

MOISS

Municipal Offline Information Sync System

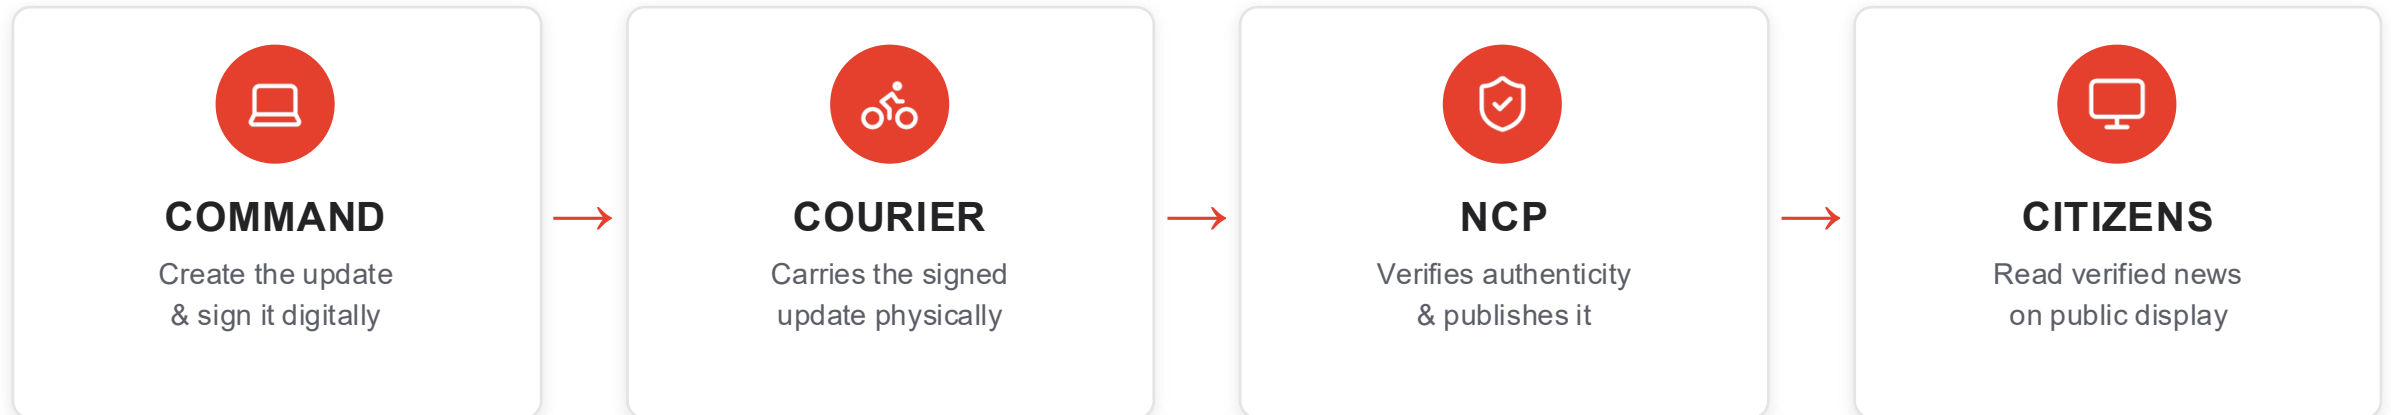

“No internet. No cellular. Verified information still moves.”

■ THE PROBLEM

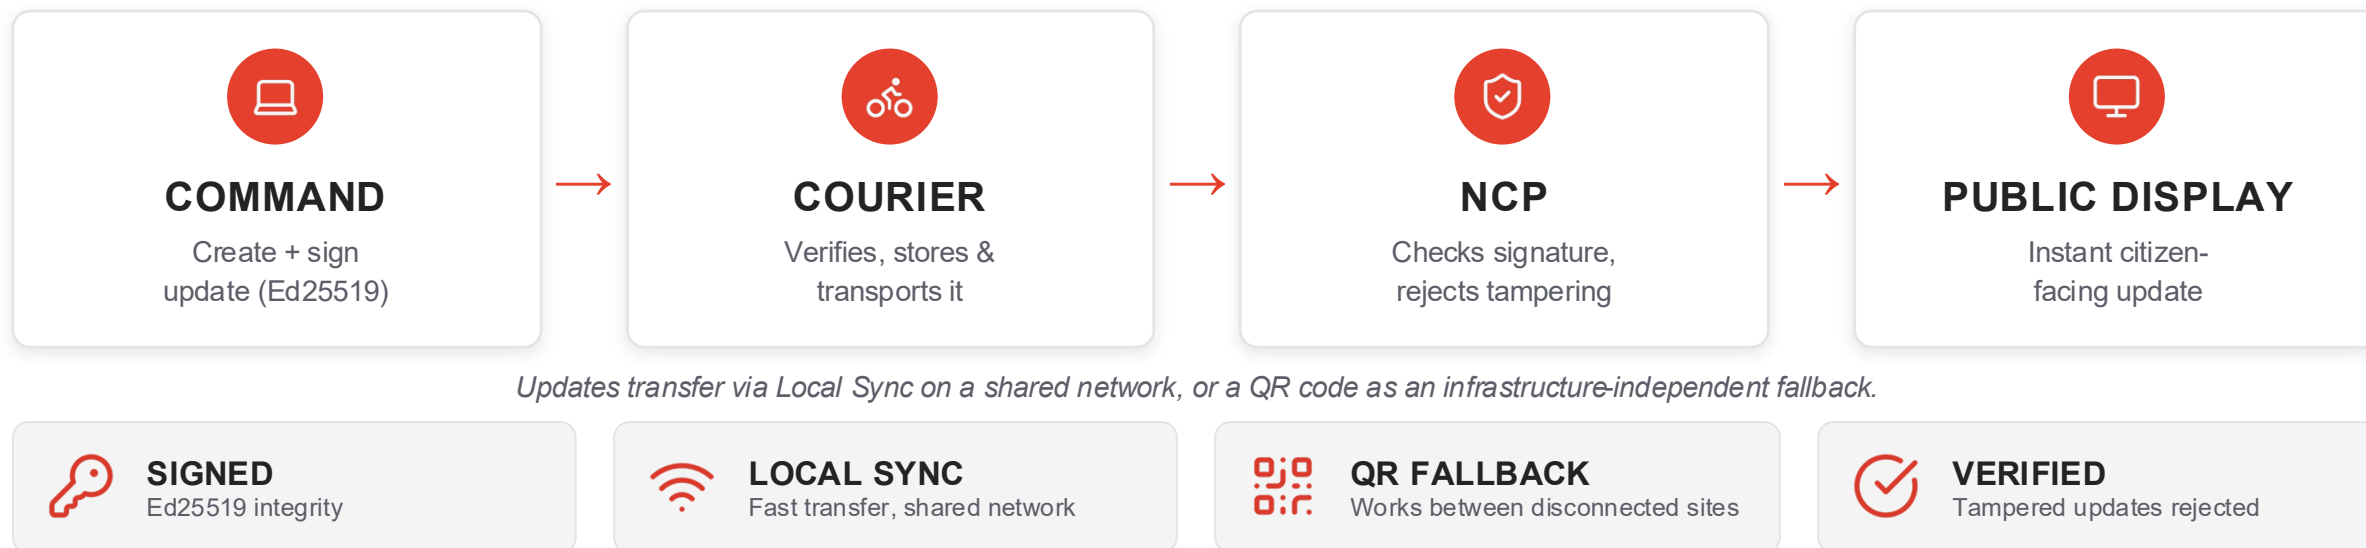

During a prolonged blackout, municipalities can lose conventional digital communication channels, making it difficult to distribute verified local crisis information.

■ THE SOLUTION

Municipal crisis coordinators · Neighbourhood information points · Citizens

From concept to working Proof of Technology in 72 hours

■ WHAT WE TESTED

- ✓ End-to-end flow: Command → Courier → NCP → Display
- ✓ Local Sync transfer on a shared network
- ✓ QR-based transfer as an offline fallback
- ✓ Ed25519 signature verification
- ✓ Rejection of invalid or tampered updates
- ✓ Publication to the public display

Proof-of-Technology validation during the 72H Design Challenge — not a formal citizen field test.

TEAM · PROJECT GROUP 72H-DC-040 2

Claudia C.A.G. Crețu · Milan M. Smieško · Georgi G.N. Totev

Hackathon prototype — not an official Gemeente Eindhoven system.

KEY LEARNING

***“Resilience is not about keeping the internet alive.
It is about keeping trusted information moving.”***

Graceful degradation beats one clever channel: Local Sync when available, QR when disconnected — information stays verifiable either way.
